.Document A: Aman Waghmare
Document B: Alexis Lanuza

Step one of the task was to compare two design documents,

After comparing the two design documents, The decision was made to derive the h1 heading box from Document A to create the heading within the webpage. This was done for primarily aesthetic purposes as the box had a colour gradient gradually going from white to gray which we decided to adapt rather than using a gradient to use the opacity setting modifying the opacity over a wallpaper creating an ambient background that was aesthetically pleasing but not too bland or colorful as to distract the visitor .The structure of the document in terms of where the divisions are positioned was derived from document b.

In the design document (B), there was the concept that the output would be displayed as text on the once the value had been entered, we have decided to implement this idea which is similar to the guessing game.

In terms of the graph, we have decided that the graph will be used for income tax and will be positioned below the input box, this is so the input and output will be easily visible and so there would be less distractions for the visitor..

We have included a rule table for the citizens to read the taxation rules concerning each income bracket, this will be above the input box.

We have also decided to use a footer primarily for aesthetics, in this case usually the footer would contain navigation options but since it is one webpage, we have decided to place the government contact there instead.
